/= keap-pols

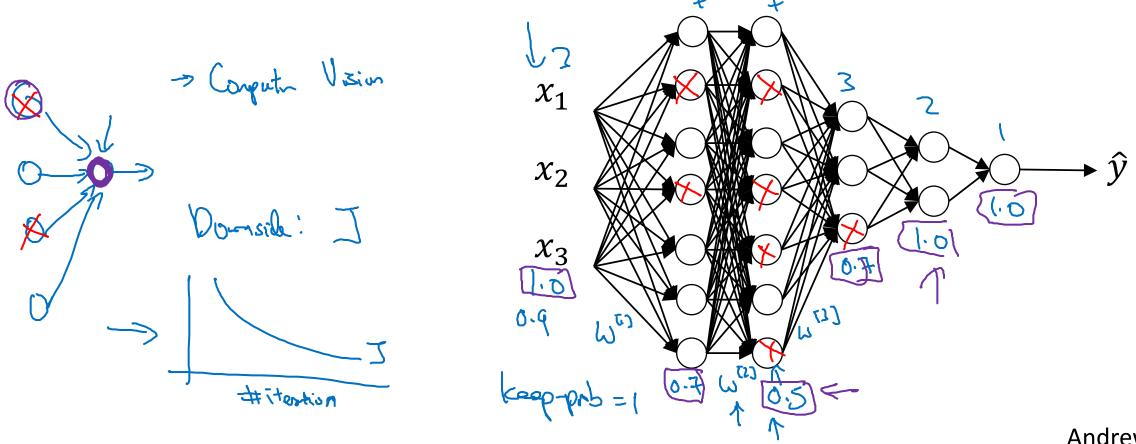

### Regularizing your neural network

# Understanding dropout

### Why does drop-out work?

Intuition: Can't rely on any one feature, so have to spread out weights. Shrink weights.

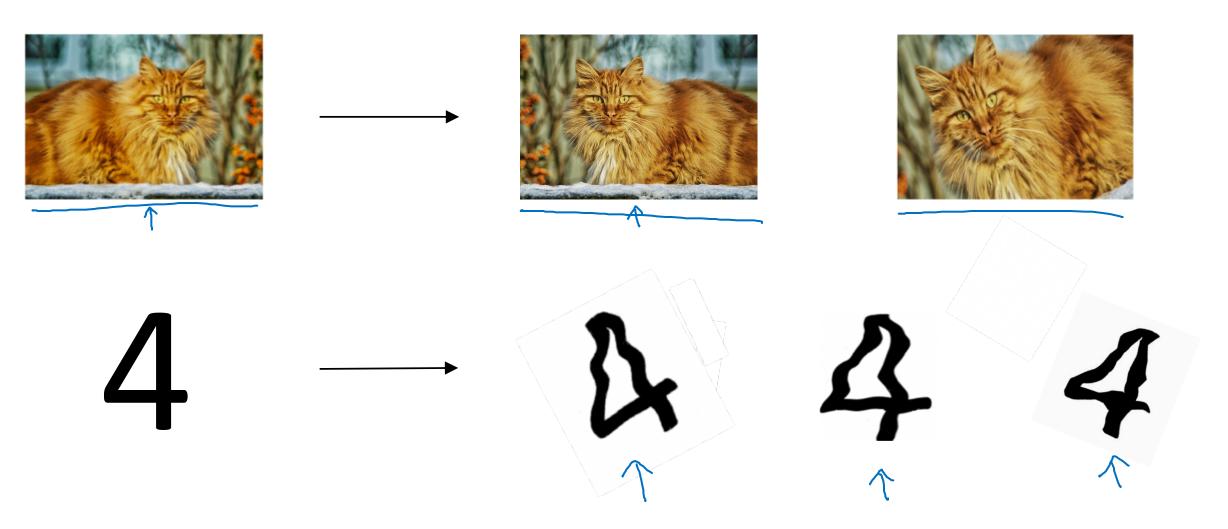

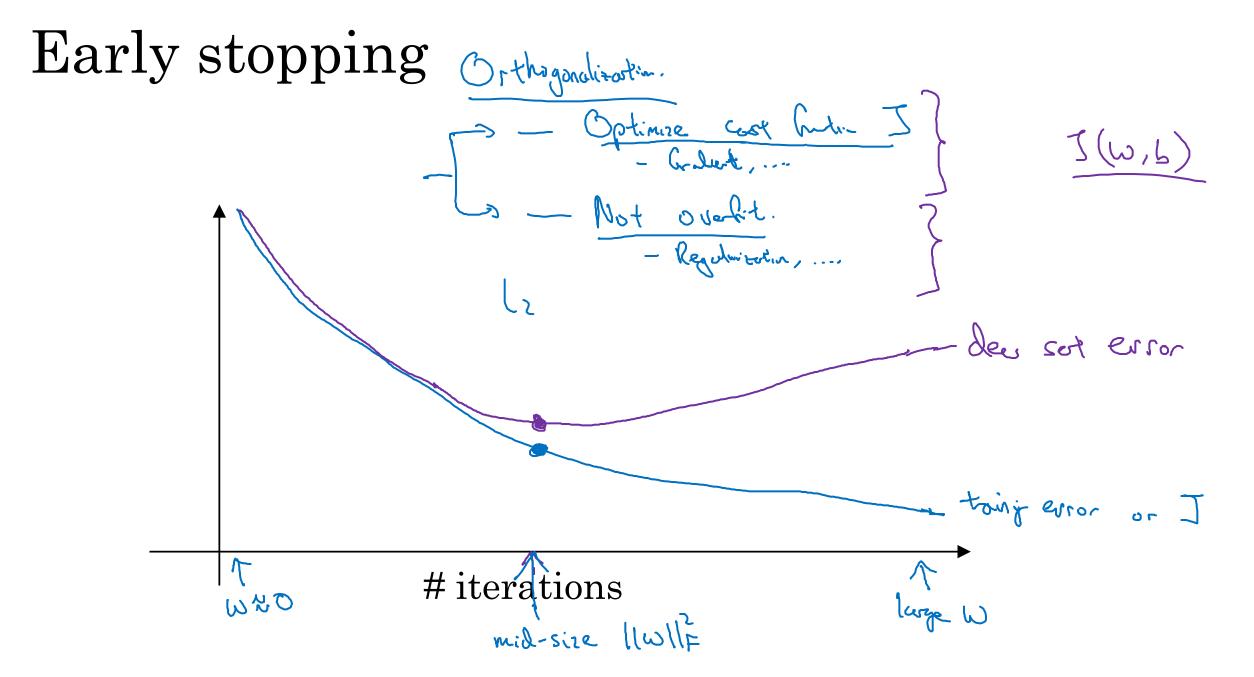

### Regularizing your neural network

# Other regularization methods

### Data augmentation

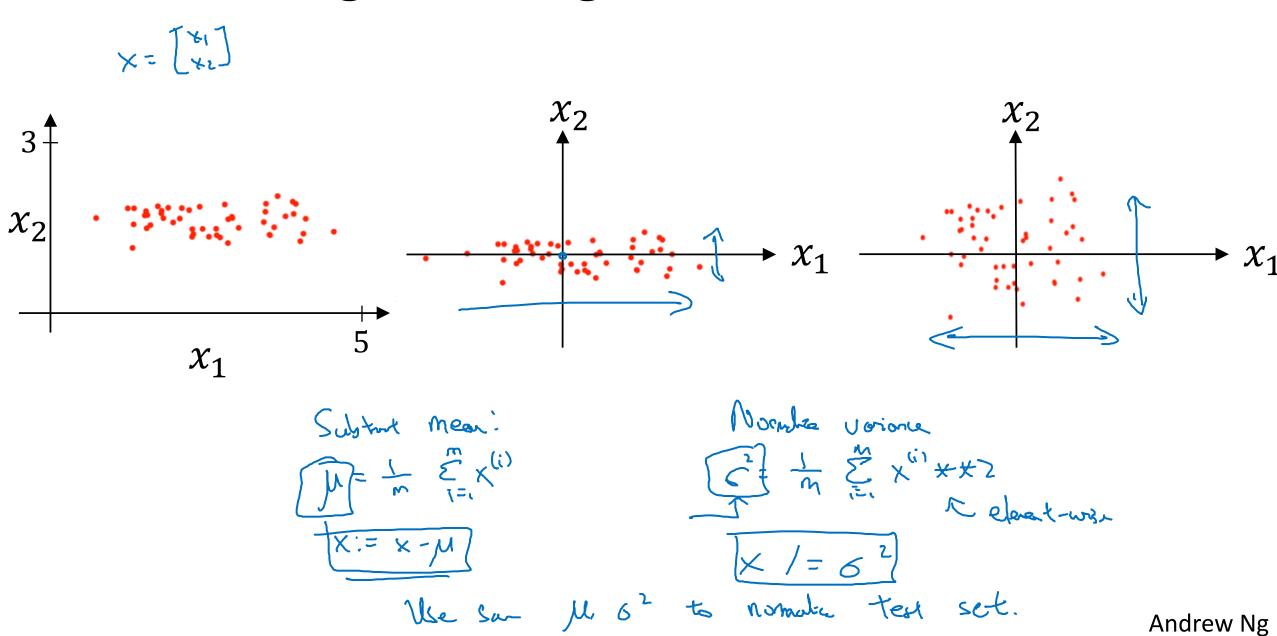

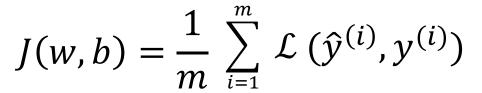

## Setting up your optimization problem

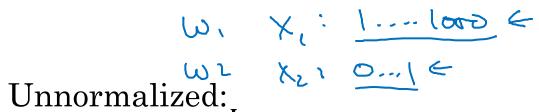

### Normalizing inputs

### Normalizing training sets

### Why normalize inputs?

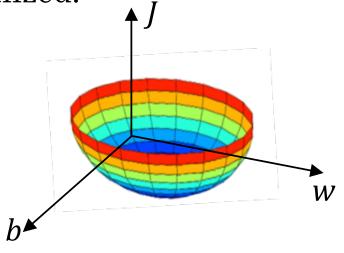

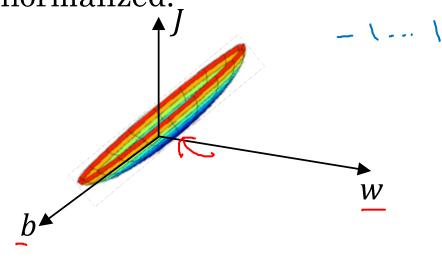

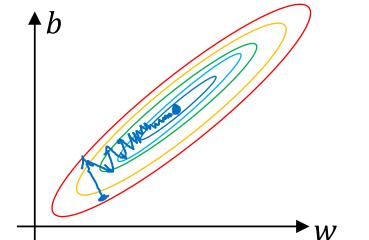

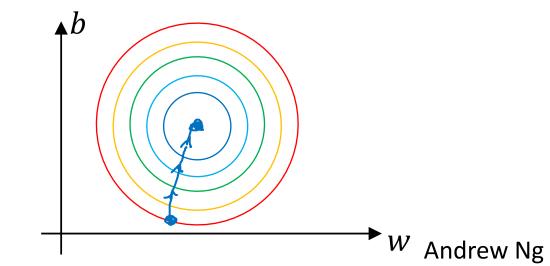

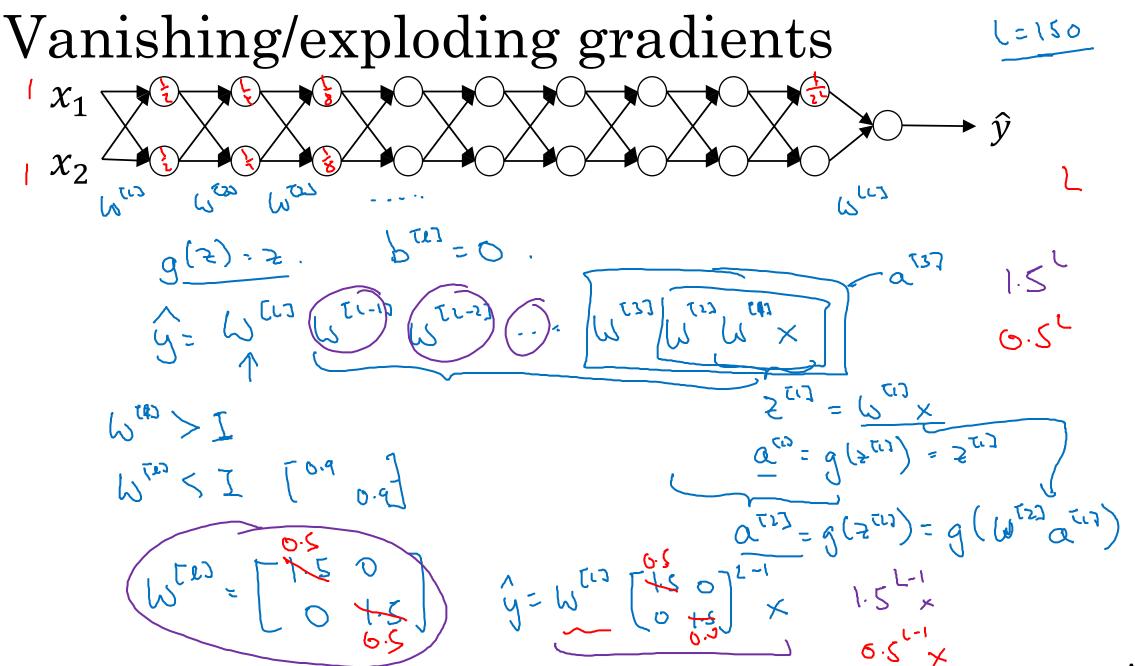

$$x_{2}: -1 = 1$$
 $x_{3}: 1 = 2$

### Gradient Checking

#### Gradient check for a neural network

Take  $W^{[1]}$ ,  $b^{[1]}$ , ...,  $W^{[L]}$ ,  $b^{[L]}$  and reshape into a big vector  $\theta$ .  $\mathcal{J}(\omega^{CD}, b^{CD}, \omega^{CD}, b^{CD})^2 \mathcal{J}(\theta)$ 

Take  $dW^{[1]}$ ,  $db^{[1]}$ , ...,  $dW^{[L]}$ ,  $db^{[L]}$  and reshape into a big vector  $d\theta$ .

Is do the gradet of J(0)?

### Gradient checking (Grad check)

for each 
$$\bar{c}$$
:

 $\Rightarrow \underline{AOCiJ} = \underline{J(O_1,O_2,...,O_i+E_1,...)} - \underline{J(O_1,O_2,...,O_i+E_1,...)}$ 
 $\Rightarrow \underline{AOCiJ} = \underline{JJ}$ 
 $\Rightarrow \underline{AOCiJ} = \underline{JJ}$ 

Check

 $\underline{IAO_{appar} - AoII_2}$ 
 $\Rightarrow \underline{IIAO_{appar} - AoII_2}$ 
 $\Rightarrow \underline{IIAO_{appar} - I_2 + IIAOII_2}$ 
 $\Rightarrow \underline{IIAO_{appar} - I_2 + IIAOII_2}$ 
 $\Rightarrow \underline{IIAO_{appar} - I_2 + IIAOII_2}$ 
 $\Rightarrow \underline{IIO^{-3} - \omega_{oiny}}$ 

# Setting up your optimization problem

Gradient Checking implementation notes

### Gradient checking implementation notes

- Don't use in training – only to debug

- If algorithm fails grad check, look at components to try to identify bug.

- Remember regularization.

- Doesn't work with dropout.

- Run at random initialization; perhaps again after some training.
